MD Examination of  
Dermatology  
Commentary

April 2012

Time allowed:

A 35-years old female presented to the outpatient clinic with multiple closely set skin's colored glistening small nodules affecting skin above the upper lip.

The lesions were asymptomatic and of 8 years duration.

Lesional biopsy showed:

- Granulomatous formation
- Infiltration with lymphocytes, histiocytes and foreign body giant cell
- Basophilic and shadow cells were also present

Routine laboratory investigations were normal

What is your diagnosis?

Discuss it

Good Luck
